

Project Ideas:

1. A trending activity application. Enter location and time (any other info) and Google trends api takes that info to produce the top trending words in that area at that time. Those words will get fed to a Yelp, Trip Advisor, or other activity planning/review API to suggest the most popular activities/locations to visit based on those trending keywords. Users will have the option to log in via Facebook. The idea of this application is to make the travelling process less stressful and give users information on popular events or places in the city *at that time*.
2. A workout and nutrition application where the user inputs their workout routine and schedule in conjunction with their nutrition goals. After a workout, users will be able to decide whether they want an in-home meal or stop by a restaurant to eat. The user will be able to decide on one or two key ingredients that they want to eat. Afterwards, based on the Spoonacular API, recipes will be recommended for the user to eat at home and the GoogleMaps & Yelp API will collect a certain amount of restaurants either around the user's location or around the user's home.
